

Christmas Tree Care

- 1. All Trees must have a fresh cut prior to placing the tree in a stand! Cut the trunk at least 1 inch from the bottom to have a fresh cut! When you place a new cut on the tree it will drink water better.**
- 2. Do not place the tree in a window, or by any heat sources! This will cause the tree to dry out quicker. The tree should be kept in a cool area.**
- 3. It is very important to ensure your tree is placed in water as soon as a new cut is placed on the tree! We sell preservative in the shop that will help soften wood fibers to promote liquid absorption. The preservative also provides more nutrients and minerals to your tree while in your house.**
- 4. Check the water level every day! Always keep the water level above the fresh cut to ensure the sap does not seal over and stops your tree from absorbing water.**
